CS385 Team Project Document

Team Name: Thames
Author: Chen Cheng

➢ Why did I develop this app?

I did it because communication was a necessary thing for mankind. We communicate with different people every day anywhere. So the application like I did is playing a very important role in peoples' life.

➢ How did you design the app?

I try to design the application more closely to a "native mobile application", at least in appearance because people are used to communicating on smartphones nowadays. Therefore it is a good choice to use a UI framework called bootstrap which can make a web application not only more beautiful than ever but auto adaptation on mobile screen. Besides, it is mandatory to use React while developing and I selected Firebase, a cloud database product from Google, as my database.

➢ How did you implement the functionality in the app?

There are three major functionalities in my application namely sign in, sign out, and chat. Each of them is corresponding to a JS file including SignIn.js, SignOut.js, and Chat.js which is easy to manage and code. All of them need support from the firebase. I realized all of these functionalities in one week.
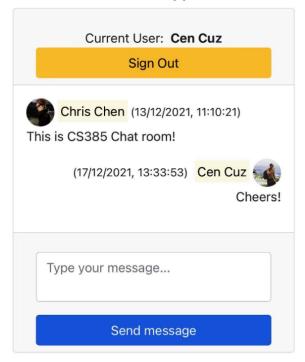

➢ Overall evaluation (it is a good or bad application!)

Though my application looks simple, it is absolutely pragmatic. I learned more and I am pretty satisfied with this (individual)team project. I reckon it is a good application.
